

Please answer the following questions to the best of your ability. The purpose of this assignment is to help me understand what our class might already know about our next topic. You will not be graded.

1. When precipitation falls outside your home, such as rain or snow, where do you think it goes when it is no longer in puddles or snow drifts in your neighborhood?
2. When water that has fallen as precipitation leaves your area, what substances do you think might be carried along with the water?
3. Why do you think it might be important to learn about where our local precipitation ends up and what the water might carry with it?
